

# small bubble cosmetology instrument

Blackhead Removal

Hydration

Whitening

## General Instructions

User Notice: This product is a home beauty device and is not a medical device.

To ensure optimal performance and safety, please read the instructions carefully before use.

## Product Principle

The bubble pen uses vacuum negative pressure water circulation to deeply cleanse the face, removing aging cuticles and sebum, as well as pore dirt, blackheads, acne, and residual makeup foundation. The multifunctional head converts hydrating essence molecules into micromolecules, which are then introduced into the facial skin to activate collagen, lifting, firming, brightening, and rejuvenating the skin, among other benefits.

## Function Introduction

### 1.Bubble Pen

Remove blackheads, cleanse skin, and improve oily skin. (The back of the instrument has a clean water bottle and a waste water bottle. The clean water bottle can be filled with purified water or a micro-bubble solution. The waste water bottle does not need to be filled with water. The waste water bottle is used to recycle the used water. If the water is full, it should be poured out immediately to prevent it from overflowing into the instrument. The front of the instrument has suction and water flow adjustment.)

### 2.Oxygen Injection Device

Add essence water into the pot (liquid is required, thick products need to be diluted with purified water). Watery products are best. Spray 3-5 cm away from the face. Spray toner or essence water on the facial skin to replenish moisture for the skin and make it more hydrated and smooth.

### 3.Ultrasonic Infusion Device

Apply gel or essence on your face, and use the ultrasonic wave guide to gently touch the skin and slide it in circles or lift it upwards. This will break down the skincare products into small molecules and introduce them deep into the skin, promoting their absorption, improving skin firmness, and making it more hydrated and shiny.

### 4.Hot and Cold Instrument

A blue light ice hammer massage on the face cools the skin, locks in moisture, and tightens pores. Red light heating opens pores, improving absorption and making the skin more elastic.

### 5.LED Mask

7 color mask has different colors. Light acts on the skin through specific wavelengths, which can help the skin repair various skin problems and improve skin condition. When using the seven-color mask, choose the light color that suits your skin.

### 6.Oxygen Bubble

The oxygen bubbles are very small and penetrate deep into the pores of our skin to remove impurities. The oxygen bubbles contain active factors that not only cleanse the skin but also provide it with essential oxygen, making it more vibrant.

### 7.Skin Scrubber

The frequency (between 20khz-40khz) generates micro-vibration waves to loosen and remove dirt, oil, blackheads and other substances in the skin's keratin and pores, thereby achieving deep cleansing.

### 8.Eye Introduction Device

Apply eye cream to the eyes, use the eye introduction head, gently slide it against the skin or lift it upwards. The eye cream can be refined into small molecules and introduced into the deep layer of the skin to reduce fine lines under the eyes.

## Product Parameters

Power Supply: AC110V-240V

Operating Frequency: 50HZ

Power: 15W

## Product Maintenance

1. After using the bubble pen, clean the tip with a brush. Then, place the pen in a cup of hot water. Turn on the device and let it inhale for about a minute to clean the tube . This will prevent clogging.
2. After using the oxygen injector, pour a little warm water into the bottle, spray it thoroughly, and rinse away any residual skincare products to prevent clogging.
3. After using the oxygen bubble device, place the bubble solution tube in hot water, turn on the device, and clean any remaining residue inside the tube and handle to prevent clogging.
